GUIDANCE

Updated travel related guidance for COVID-19
COVID-19 virus is circulating across the United States. While there is no longer a recommendation to self-isolate for 14 days after returning home from travel outside of Iowa and within the United States (as long as the traveler remains well and has not been identified as a close contact of an ill individual), travelers should continue to:
- Clean your hands often.
- Wash your hands often with soap and water for at least 20 seconds especially after you have been in a public place, or after blowing your nose, coughing, or sneezing.
  - If soap and water are not readily available, use a hand sanitizer that contains at least 60% alcohol. Cover all surfaces of your hands and rub your hands together until they feel dry.
- Avoid touching your eyes, nose, and mouth.
- Avoid close contact with others.
- Keep 6 feet of physical distance from others.
- Avoiding close contact is especially important if you are at higher risk of getting very sick from COVID-19.
- Wear a cloth face covering in public.
- Cover coughs and sneezes.

The Centers for Disease Control continues to recommend that persons returning from international travel stay home for 14 days after they return.

For additional information related to travel, please visit: https://www.cdc.gov/coronavirus/2019-ncov/travelers/index.html

Isolation guidance for sick and/or COVID-19 positive members of the general public
Persons with symptoms of COVID-19 should self-isolate (this includes persons who test PCR positive and persons who are not tested) until after these three things have happened:
- They have had no fever for at least 72 hours (that is three full days of no fever without the use of medicine that reduces fevers) AND
- Their other symptoms have improved (for example, when your cough or shortness of breath has improved) AND
- At least 10 days have passed since their symptoms first appeared.

Persons with symptoms of COVID-19 who are tested and test PCR negative AND who are NOT a close contact of a person who tested positive for COVID-19, can go back to daily activities 24 hours after their fever and other symptoms resolve.

Persons with symptoms of COVID-19 who are tested and test PCR negative AND who ARE a close contact of a person who tested positive for COVID-19, should continue to self-quarantine until 14 days after their last exposure to the confirmed case.

Persons who test PCR positive for COVID-19 but do not experience symptoms should self-isolate until:
- At least 10 days have passed since the date of the first positive test AND
They continue to have no symptoms (no cough or shortness of breath) since the test.

NOTE: Persons who test positive for COVID-19 on serologic testing should not be excluded, unless they also test positive for COVID-19 on PCR testing or are sick with COVID-19 symptoms and have not yet met the isolation release guidance described above.

CDC Guidance for “What to do if you are sick”:

Guidance for asymptomatic healthcare personnel exposed to individuals testing PCR positive for COVID-19
This guidance applies to HealthCare Personnel (HCP)* with potential exposure in a healthcare setting to patients, visitors, or other HCP with confirmed COVID-19. Exposures can also be from a person under investigation (PUI) who is awaiting testing. Work restrictions described in this guidance might be applied to HCP exposed to a PUI if test results for the PUI are not expected to return within 48 to 72 hours. Therefore, a record of HCP exposed to PUIs should be maintained. If test results will be delayed more than 72 hours or the patient is positive for COVID-19, then the work restrictions described in this document should be applied.

<table>
<thead>
<tr>
<th>Exposure</th>
<th>Personal Protective Equipment Used</th>
<th>Work Restrictions</th>
</tr>
</thead>
</table>
| HCP who had prolonged\(^1\) close contact\(^2\) with a patient, visitor, or HCP with confirmed COVID-19\(^3\) | - HCP not wearing a respirator or facemask\(^4\)  
  - HCP not wearing eye protection if the person with COVID-19 was not wearing a cloth face covering or facemask  
  - HCP not wearing all recommended PPE (i.e., gown, gloves, eye protection, respirator) while performing an aerosol-generating procedure\(^1\) | - Exclude from work for 14 days after last exposure\(^5\)  
  - Advise HCP to monitor themselves for fever or symptoms consistent with COVID-19\(^6\)  
  - Any HCP who develop fever or symptoms consistent with COVID-19\(^6\) should immediately contact their established point of contact (e.g., occupational health program) to arrange for medical evaluation and testing. |
| HCP other than those with exposure risk described above                  | N/A                                                                    | - No work restrictions                                               
  - Follow all recommended infection prevention and control practices, including wearing a facemask for
source control while at work, monitoring themselves for fever or symptoms consistent with COVID-19 and not reporting to work when ill, and undergoing active screening for fever or symptoms consistent with COVID-19 at the beginning of their shift.

-Any HCP who develop fever or symptoms consistent with COVID-19 should immediately self-isolate and contact their established point of contact (e.g., occupational health program) to arrange for medical evaluation and testing.

HCP with international travel or community exposures should inform their occupational health program for guidance on need for work restrictions.

1. Consider an exposure of 15 minutes or more (within <6 feet) as prolonged. Any duration should be considered prolonged if the exposure occurred during performance of an aerosol generating procedure.

2. Data are limited for the definition of close contact. For this guidance it is defined as: a) being within 6 feet of a person with confirmed COVID-19 or b) having unprotected direct contact with infectious secretions or excretions of the person with confirmed COVID-19.

3. Determining the time period when the patient, visitor, or HCP with confirmed COVID-19 could have been infectious:
   a. For individuals with confirmed COVID-19 who developed symptoms, consider the exposure window to be 2 days before symptom onset through the time period when the individual meets criteria for discontinuation of Transmission-Based Precautions.
   b. For individuals with confirmed COVID-19 who never developed symptoms, determining the infectious period can be challenging.
      i. In these situations, collecting information about when the asymptomatic individual with COVID-19 may have been exposed could
help inform the period when they were infectious. In general, individuals with COVID-19 should be considered potentially infectious beginning 2 days after their exposure until they meet criteria for discontinuing Transmission-Based Precautions.

ii. If the date of exposure cannot be determined, although the infectious period could be longer, it is reasonable to use a starting point of 2 days prior to the positive test through the time period when the individual meets criteria for discontinuation of Transmission-Based Precautions for contact tracing.

4. While respirators confer a higher level of protection than facemasks and are recommended when caring for patients with COVID-19, facemasks still confer some level of protection to HCP, which was factored into this risk assessment. Cloth face coverings are not considered PPE because their capability to protect HCP is unknown.

5. If staffing shortages occur, it might not be possible to exclude exposed HCP from work. For additional information and considerations refer to Strategies to Mitigating HCP Staffing Shortages.

6. Fever is either measured temperature >100.4°F or subjective fever. Note that fever may be intermittent or may not be present in some patients, such as those who are elderly, immunosuppressed, or taking certain medications (e.g., NSAIDs). Clinical judgement should be used to guide testing of patients in such situations. Occupational health programs should have a low threshold for evaluating symptoms and testing HCP.

---

*Healthcare Personnel (HCP):* HCP include, but are not limited to, emergency medical service personnel, nurses, nursing assistants, physicians, technicians, therapists, phlebotomists, pharmacists, students and trainees, contractual staff not employed by the healthcare facility, and persons not directly involved in patient care, but who could be exposed to infectious agents that can be transmitted in the healthcare setting (e.g., clerical, dietary, environmental services, laundry, security, engineering and facilities management, administrative, billing, volunteer personnel). For this guidance, HCP does not include clinical laboratory personnel.

**Return to work guidance for sick and/or COVID-19 positive healthcare personnel**

Symptomatic HealthCare Personnel (HCP)* with suspected or confirmed COVID-19 should be excluded from work until:

- At least 3 days (72 hours) have passed since recovery defined as resolution of fever without the use of fever-reducing medications and improvement in respiratory symptoms (e.g., cough, shortness of breath); and,
- At least 10 days have passed since symptoms first appeared

Healthcare personnel with laboratory-confirmed COVID-19 who have not had any symptoms should be excluded from work until:
• 10 days have passed since the date of their first positive COVID-19 diagnostic test assuming they have not subsequently developed symptoms since their positive test.

After returning to work, the healthcare provider should:
• Wear a facemask for source control at all times while in the healthcare facility until all symptoms are completely resolved or at baseline.
  o A facemask instead of a cloth face covering should be used by these HCP for source control during this time period while in the facility. After this time period, these HCP should revert to their facility policy regarding universal source control during the pandemic.
  o A facemask for source control does not replace the need to wear an N95 or higher-level respirator (or other recommended PPE) when indicated, including when caring for patients with suspected or confirmed COVID-19.
  o Of note, N95 or other respirators with an exhaust valve might not provide source control.
• Self-monitor for symptoms, and seek re-evaluation from occupational health if respiratory symptoms recur or worsen.

CDC “Return to Work Criteria for Healthcare Personnel with Confirmed or Suspected COVID-19”

Screening guidance
According to CDC, COVID-19 symptoms may appear 2-14 days after exposure to the virus. People with these symptoms or combinations of symptoms may have COVID-19:
• Cough
• Shortness of breath or difficulty breathing

Or at least two of these symptoms:
• Fever
• Chills
• Repeated shaking with chills
• Muscle pain
• Headache
• Sore throat
• New loss of taste or smell

IDPH has not changed business screening guidance due to the complexity of the screening process that would need to occur to account for the broader list of symptoms. Businesses can create their own algorithm for screening based upon the expanded CDC information or they can continue to use the current IDPH screening algorithm available at:
https://idph.iowa.gov/Portals/1/userfiles/7/bscreening%20algorithm%2003222020.pdf

Guidance for Critical Infrastructure Workers exposed to COVID
Critical infrastructure workers, including personnel in 16 different sectors of work including:
• Federal, state, & local law enforcement
• 911 call center employees
• Fusion Center employees
• Hazardous material responders from government and the private sector
• Janitorial staff and other custodial staff
• Workers – including contracted vendors – in food and agriculture, critical manufacturing, informational technology, transportation, energy and government facilities

Critical infrastructure workers may continue work following potential exposure to COVID-19, provided they remain asymptomatic and additional precautions are implemented to protect them and the community. A potential exposure means being a household contact or having close contact within 6 feet of an individual with confirmed or suspected COVID-19. The timeframe for having contact with an individual includes the period of time of 48 hours before the individual became symptomatic.

Critical Infrastructure workers who have had an exposure but remain asymptomatic should adhere to the following practices prior to and during their work shift:

Pre-Screen: Employers should measure the employee’s temperature and assess symptoms prior to them starting work. Ideally, temperature checks should happen before the individual enters the facility.

Regular Monitoring: As long as the employee does not have a temperature or symptoms, they should self-monitor under the supervision of their employer’s occupational health program.

Wear a Mask: The employee should wear a face mask at all times while in the workplace for 14 days after last exposure. Employers can issue facemasks or can approve employees’ supplied cloth face coverings in the event of shortages.

Social Distance: The employee should maintain 6 feet and practice social distancing as work duties permit in the workplace.

Disinfect and Clean Work Spaces: Clean and disinfect all areas such as offices, bathrooms, common areas, shared electronic equipment routinely.

COVID-19 Testing Framework for Iowa (updated 05.27.2020)
Healthcare providers can test patients, as they deem appropriate for COVID-19 infection at national reference laboratories. If healthcare providers choose to test a patient through a national reference laboratory, there is no need to call IDPH for approval. The specimens should be sent directly to the reference laboratory in accordance with the laboratory’s guidance. Reference laboratories will charge patients for this testing; public health has no funding to cover the costs of these tests.

Viral Test for COVID-19
The State Hygienic Laboratory will continue to perform COVID-19 PCR testing in accordance with one of the following criteria (these criteria may broaden as the pandemic expands and additional testing resources become available).

• Hospitalized patient (of any age) with fever or respiratory illness for diagnosis or any hospitalized patient prior to discharge to a long term care facility or other nursing care facility
- Older adult (> 60 years of age) with fever or respiratory symptoms (e.g., cough, difficulty breathing) and chronic medical conditions (e.g., diabetes, heart disease, immunosuppressive medications, chronic lung disease, or chronic kidney disease)

- Person of any age with fever or respiratory illness who lives in a congregate setting (i.e., long term care facilities, dormitories, residential facilities, correctional facilities, treatment facilities)

- Healthcare worker, essential services personnel, first responder or critical infrastructure worker with fever or respiratory illness (e.g., healthcare worker, fire, EMS, law enforcement, residential facility staff, food supply and water plant operators)

- Children receiving care in and Staff working in childcare homes and childcare centers with fever or respiratory symptoms (e.g., cough, difficulty breathing) without alternative diagnosis

- Symptomatic and asymptomatic close contacts (defined as spending more than 15 minutes within 6 feet) of persons who test positive for COVID-19 infection using PCR viral testing. Close contact testing should not occur until at least 48 hours after the earliest exposure to COVID-19 positive persons.

If patients meet the testing criteria, please submit the specimen to the State Hygienic Laboratory in accordance with the diagnostic PCR testing guidance available at, http://shl.uiowa.edu/dcd/covid19.xml. The cost of this testing is assigned to the public health system. Please ensure you are using appropriate infection control guidance when collecting specimens, which includes at a minimum contact and droplet precautions with eye protection.

**Antibody Testing for COVID-19**

The State Hygienic Laboratory will perform COVID-19 serology (antibody) testing in accordance with one of the following criteria (these criteria may broaden as the pandemic expands and additional testing resources become available).

- A patient suspected or confirmed to have COVID-19 who is greater than 7 days post symptom onset, or a patient exposed to a known case of COVID-19 more than 7 days in the past

- Identification of persons with an antibody response to serve as convalescent plasma donors

- Healthcare worker, essential services personnel, first responder or critical infrastructure worker (e.g., healthcare worker, fire, EMS, law enforcement, food service worker and residential facility staff) for whom knowledge of antibody production is needed
If patients meet the testing criteria, please submit the specimen to the State Hygienic Laboratory in accordance with the serologic antibody testing guidance, available at http://shl.uiowa.edu/dcd/covid19.xml. The cost of this testing is assigned to the public health system.

CASE INVESTIGATION AND CONTACT TRACING PROCEDURES

Test types and the Iowa Disease Surveillance System
There is an increasing number of test types being on-boarded in Iowa and at reference laboratories across the nation. There are two main categories of testing, PCR testing and serology testing. IDPH has decided to separate these two types of testing into two different diseases on the Iowa Disease Surveillance System. This decision to separate into two distinct diseases was made in an effort to prevent confusion and streamline the reporting process.

A positive PCR test indicates a current COVID-19 infection.
- PCR results are categorized in Iowa Disease Surveillance System under the disease name “2019 Novel Coronavirus”

A positive serology test indicates a past or recent COVID-19 infection.
- Serology results are categorized in the Iowa Disease Surveillance System under the disease name “Serology COVID-19”

Additional information about PCR and serology testing is available at:

PCR case investigation and contact tracing procedures
Local public health partners that have decided to complete their own case investigations and contact tracing should run an IDSS “local outstanding follow-up report” to identify positive results that need investigated. To run a “local outstanding follow-up report” log into the IDSS system and click on the printer icon at the top left side of the dashboard.

Select “local outstanding follow-up report” from the list and the report will generate, listing the open cases in IDSS for your jurisdiction.
Local public health departments should perform case investigations in accordance with normal investigation procedures. In addition, IDPH is asking local public health to identify all persons that the case had contact with during their infectious period.

Contact is defined as being **less than 6 feet away from someone for more than 15 minutes**

Infectious period for asymptomatic cases is defined as **48 hours before through 10 days after** the first date the patient tested positive for COVID-19 infection.

Infectious period for symptomatic cases is defined as **48 hours before illness started until the patient is fever free for at least 72 hours AND other symptoms have improved AND at least 10 days have passed since the first symptom began.**

Local public health is asked to:
- identify all persons meeting the contact definition
- call each contacts, ask whether they have been ill, and instruct them that they have been exposed to COVID-19 and provide guidance accordingly
- advise all contacts (asymptomatic and symptomatic) that it is recommended (not required) that they be tested for COVID-19 infection (testing should not occur before 48 hours after their earliest exposure to the COVID-19 infected case)
- all contacts should be recorded in the “contacts” section in the Iowa Disease Surveillance System (as shown below)
- ill contacts should be entered as epi-linked cases in the Iowa Disease Surveillance System

**Household contacts** should be entered in the “Household Contacts” section of the Iowa Disease Surveillance System:

| Number of people living in case’s household: | 5 |
| Household contacts: | Yes |

All other contacts should be entered in the “Other non-household contacts” section of the Iowa Disease Surveillance System:
Serology Case Investigations
Beginning on Monday, May 11, 2020, IDPH will be asking local public health partners to conduct investigations for persons with positive serology results. Local public health departments should perform case investigations in accordance with normal investigation procedures. As serology positive results indicate past infection (and the infectious period cannot be determined), no contact tracing is conducted for these cases.

Long Term Care Illness and Outbreak Investigation
When one or more resident(s) of long term care facilities test positive for COVID-19, IDPH and the appropriate local public health department will hold a conference call to discuss the following:

  - Screen all employees for fever and cough/breathing problems at start and end of each shift. Ill staff should be sent home immediately.
  - Isolate all symptomatic residents in single rooms.
  - Cohort staff so that dedicated staff are working with ill residents and not with healthy residents.
  - Employees should use face masks and eye protection ALL times for ALL resident care.
  - Consider gown and glove use at all times for all resident care (if available).
  - No visitors should be allowed in the facility (unless end of life situation per CMS guidance).
  - Screen all patients for fever and cough/breathing problems daily.
  - Coordinate with local public health department, EMS and hospitals to plan for higher care needs (when and where to transfer and how to communicate COVID-19 risk to transport team and accepting facility).
  - Understand that the residents’ illness may worsen on day 7 to 8 of symptoms.
  - Work with local public health to ensure test kits are readily available for any additional residents that become symptomatic.
  - Identify other healthcare facilities where staff work. Staff should not work in other facilities if possible, or should use a face mask with eye protection for all patient care in any health care setting.
  - Establish a plan for communication with staff, residents and families, public health, and the public.

- Discuss PPE needs
- Competency in hand hygiene and PPE donning and doffing.
• Review environmental services cleaning products and procedures
• Discuss testing supply needs
• Discuss current staffing needs and staffing contingency plans (i.e., relationship with parent company or staffing agency)
• Discuss adherence to routine PPE use recommendations and familiarity with donning and doffing procedures

From that call forward, local public health is asked to contact the long term care facility daily to:
• Review newly identified symptomatic or confirmed residents/staff
• Discuss epidemiologic links of new cases to previous cases (i.e., are they on the same hallway/neighborhood)
• Discuss adherence to routine PPE use recommendations and familiarity with donning and doffing procedures
• Review environmental services cleaning procedures
• Discuss how the staff and patient cohorting plan may need to be altered based on the positive case (do we need to start cohort staff on another hallway/neighborhood/wing)
• Discuss whether wider hallway/neighborhood/wing testing is indicated
• Discuss patients potential for worsening and transfer plan if higher level of care is needed
• Discuss current PPE needs
• Discuss current testing supply needs
• Discuss current staffing needs

IDPH staff will create an “Outbreak Name” corresponding to each long term care facility with at least one reported case in a resident. The “Outbreak” field within the Iowa Disease Surveillance System appears in the “Event continued” tab. Local public health departments should identify all LTC staff and residents tested for COVID-19 (both positive and negative results) as being associated with the specific long term care facility where they work or reside in the Iowa Disease Surveillance System (by selecting the LTC facility name from the outbreak list). If a staff member lives in another county (and LPH does not have access to the case), please notify Amanda Casson at IDPH (amanda.casson@idph.iowa.gov) and she will apply the outbreak field for that staff member in the Iowa Disease Surveillance System.

In addition, IDPH is asking that all local public health departments consider completing case investigations on long-term care residents if possible since they will be contacting those facilities daily. Because contact tracing will need to occur with long term care staff and staff may live in other counties, IDPH would propose handling the staff investigations like all other non-resident cases occurring in the county.

Starting on Monday, May 11, 2020, IDPH will no longer request that local public health partners/long term care facilities update line lists. Local public health partners may choose to continue using the line list at their discretion; however, it does not need to be sent to IDPH.
NOTE: IDPH is assigning outbreaks to cases in IDSS that are listed in the current tracking spreadsheets, but local public health is asked to transition to assigning cases to outbreaks in IDSS starting on Monday, May 11, 2020. This request is being made of all LPH partners, including the LPH departments that have requested that the state investigate cases within their jurisdiction.

Long term care facilities with at least three residents that test positive for COVID-19 will be listed on the outbreak dashboard on the COVID.iowa.gov webpage. The data for the dashboard will be exported directly from the Iowa Disease Surveillance System. Facilities will remain listed on the dashboard until 28 days (2 incubation periods) after their most recent new case became ill/was identified.

**State assistance with investigations and contact tracing**
State resources are available to assist local public health departments in completing both PCR and serology investigations. Local public health departments can defer all PCR and/or Serology investigations to the state by contacting their assigned IDPH Field Epidemiologist.

Local public health departments can access both PCR and serology test and case investigation information for residents in their jurisdiction at any time by logging into the Iowa Disease Surveillance System.

**Support for Businesses**
The expanded testing framework described above allows ill critical infrastructure workers presenting to healthcare with COVID-19 symptoms to be tested through the State Hygienic Laboratory.

For additional COVID-19 guidance and consultation for Iowa businesses, please contact covid19business@iowa.gov.
